About this Directory

This directory has been established as an informational listing only, and is not to be taken as a recommendation or guarantee of name brands or workmanship. It was developed from a survey sent to area dealers, contractors, and electricians, that were known to handle electric heating and cooling systems. We hope that this information will ease the task of locating a technician to install or service your electric heating and cooling needs.

For ease of use, businesses are listed alphabetically by the town in which they are located.

Incentives

Area public power districts may offer incentives to their customers who install electric heat or water heaters in new homes or convert existing fossil fuel systems to electric. You may also be able to obtain a Home Heating Estimate that will provide annual heating and/or cooling projections for your home. For more information on these services please contact your local power suppliers.

What you need to know when selecting a... *heat pump contractor*

Choosing a contractor to install the system is the most important decision you will make when buying a heat pump. This—even more than brand name and price—can have the greatest impact on the life and efficiency of the system because most problems with heat pumps result not from poor equipment, but improper installation.

Use the following check list to evaluate contractors who are bidding on installing a heat pump. And remember that the lowest bid will not necessarily be the one you should accept.

A thorough heat-gain/heat-loss calculation is highly recommended to assure proper sizing of the heat pump system. It should also include a cost of operation analysis.

Will the contractor do a heat-gain/heat-loss calculation and show you the results before installing the heat pump system?

Yes No

Ask the contractor his personal opinion of heat pumps. Does he speak favorably of them and sound as enthusiastic about them as you are?

Yes No

A properly designed heat pump system requires precisely designed ductwork. Did he clearly explain what ductwork he will install?

Yes No

Does it need to be installed?

Yes No

Does he offer a guarantee of satisfaction upon completion of the installation?

Yes No

Has he explained what parts and labor the warranty covers and for how long?

Yes No

Does he offer an extended warranty?

Yes No

Does he provide 24-hour emergency service?

Yes No

Will he provide an owners manual and clear instructions for home maintenance—especially air filter replacement/cleaning?

Yes No

Have he and his installers received certification for the installation they will be making?

Yes No

When was the last training seminar attended?

Date: _____

The contractor should be installing or subcontracting all associated water line connections so this is included in the installation cost of a ground-source heat pump. Has this been included?

Yes No

To receive the most benefit from a de-superheater on ground-source heat pump, a storage tank should be installed in addition to the electric water heater. Did he suggest or include a storage tank in his estimate?

Yes No

Heat pump installers are typically not licensed electricians and therefore do not include the cost of the wiring required to make it a “turn-key” operation. Has he listed this and all other requirements that will be the homeowner’s responsibility?

Yes No

The contractor should provide at least five local references for you to visit with. List them below; then contact them.

Heat Pump Information

Brand Name: _____

Size in Tons: _____

Auxiliary Heat kW _____

SEER/EER Rating: _____

Open Loop: _____ Closed Loop: _____

Total Bid Price: _____

Electric heat pumps reduce your energy costs all year long.

- An electric furnace is inexpensive to install, safe to operate and requires little maintenance.
- An electric furnace is flameless, eliminating the need to relight a pilot light or bring combustible fuels into your home and does not require additional fuel pipes or expensive venting.
- Electric heat is 100% efficient.
 - Baseboard heaters are the ideal room-by-room solution that heat each room seperately.
 - Electric cove heat distributes radiant heat to objects in the room and are mounted near the ceiling so that the radiant panels direct the heat downward.
